VC-300HD Multi Format Converter

System Integration

Introduction

Established in 1988 Heart Network is a CATV station covering Niihama and Saijo area of Ehime Prefectures in Japan. Their main objective is to broadcast local content to the community.

The System

HD-SDI output from video mixer and analog signal from audio mixer comes in to VC-300HD. The audio signal is embedded as part of SDI signal and sent to video server for broadcast. At the same time, the HDV output from VC-300HD is sent to the VCR for backup.

Point of Selection

- Mr. Saiotoh, System Integrator

While installing their HD video system, they needed to look for a solution that could take audio from their mixer and combine with their video signal for broadcast.

They checked many converters with HD-SDI in/out but found that none had the features they needed or the price was too high.

The VC-300HD was a perfect solution for them and price was within their budget. Furthermore, they can use the multi output function for HDV backup. This solution matched their ideal concept of "Highest Performance with Lowest Investment".
