Installed Equipment

EDIROL V-440HD
DV7-DL (five units)

Introduction

Warsaw Community High School in Indiana offers students an enhanced vocational curriculum including broadcast production training. In the last five years the radio and TV program has grown from a few cameras and VCRs to a three camera production studio complete with the latest technology including an EDIROL V440 HD video mixer, five DV7 DL editors and three Sony HD cameras.

System

The High School students in the television broadcast program begin with little knowledge of broadcast technology. In order to get the students working quickly, the school chose EDIROL's V440 HD and DV7-DL because of their short learning curve and reliable technology. The teachers and students prefer EDIROL's dedicated editing machine the DV7-DL to the instability of personal computers. Dave Baumgartner, Radio & Television Instructor at Warsaw Community High School, explains, "they are perfect for us because they are fast, reliable and not subject to viruses and system conflicts. We have them in all five of our editing bays because we can count on their stability, high quality video and voice over ease. Plus, students feel safer putting their content on to the DV7-DL hard drives because they don't crash and they have automatic file backup features in case of power outages."

"My students spend more time being creative and learning about broadcast technology rather than configuring video hardware and dealing with software compatibility because of these wonderful video production tools from EDIROL by Roland."

- Dave Baumgartner, Warsaw High School
